Our knowledge of cholinergic synaptic transmission in the peripheral nervous system (PNS) has expanded enormously since the early 1930's, at which time O. Loewi discovered chemical neurotransmission through acetylcholine (ACh) and the pharmacological actions of ACh were described by H. Dale and his colleagues. Types of cholinergic synapses very similar to those found in the hippocampal formation were also observed in other brain regions containing cholinergic neurons and terminals. This lends support to the view detailed in this chapter that the septohippocampal projection is a useful model for studies of cholinergic synaptic mechanisms in the CNS.
