An ionic liquid (IL) is a salt in the liquid state. In some contexts, the term has been restricted to salts whose melting point is below some arbitrary temperature, such as 100 C (212 F). While ordinary liquids such as water and gasoline are predominantly made of electrically neutral molecules, ionic liquids are largely made of ions and short-lived ion pairs. These substances are variously [Ionic Liquid - an overview | ScienceDirect Topics](#) Ionic liquids are chemicals that are nonvolatile in nature and hence can be good candidates for replacement of volatile organic compounds in many industrial applications. A large number of ionic liquids, through the combination of different cations and anions, can potentially be synthesized.

We have developed a simple and quantitative explanation for the relatively low melting temperatures of ionic liquids (ILs). The basic concept was to assess the Gibbs free energy of fusion ($\Delta_{fus}G$) for the process IL (s) IL (l), which relates to the melting point of the IL.

IONIC LIQUIDS CLASSES AND PROPERTIES

The history of ionic liquids (and the closely related molten salts) has a rather ill- defined beginning, although it is most commonly dated back to 1914 and the work of Walden on the use of alkylammonium nitrates. 2,3 The next burst of interest

2018 Ionic Liquids Conference GRC

Ionic liquids have been known for over a century, but they spent much of that time in relative scientific obscurity. Yet, beginning around 1998 interest in these unorthodox salts exploded, and in the intervening period some 85,000 papers have been published on the topic a truly remarkable, near-unprecedented rate of development.

Ionic liquids in carbon capture - Wikipedia

The use of ionic liquids in carbon capture is a potential application of ionic liquids as absorbents for use in carbon capture and sequestration. Ionic liquids, which are salts that exist as liquids near room temperature, are polar, nonvolatile materials that have been considered for many applications.
