Metabolomics - Wikipedia

Metabolomics is the scientific study of chemical processes involving metabolites, the small molecule intermediates and products of metabolism. Specifically, metabolomics is the "systematic study of the unique chemical fingerprints that specific cellular processes leave behind"; the study of their small-molecule metabolic profiles. Molecular biology operates at three levels genes, proteins and metabolites. This book is unique in that it provides a comprehensive description of an approach (metabonomics) to characterise the endogenous metabolites in a living system, complementing gene and protein studies (genomics and proteomics).

Metabolomics vs Metabonomics: Metabolomics is the study of the complete set of metabolites of an organism; Metabonomics is the quantitative study of multiparametric metabolic responses of living systems in temporal basis to pathophysiological stimuli or genetic modification.

Of Terms in Biology: Metabolomics and Metabonomics

What is metabolomics? Oh, that's easy. It's the study of the metabolome. Very good. Now, what is the metabolome? Ergo, metabolomics is the study of the complete collection of metabolites present in a cell or tissue under a particular set of conditions (= the metabolome) generating a biochemical

Metabolomics, then again metabonomics, a rising field of biochemical investigation, is an equal technique to genomics, transcriptomics, and proteomics. Coordinate quantitative estimations of metabolite articulations in pee, serum, plasma, and tissue are significant for the examination of natural methods in common and disease states. Ensuing to the amount of metabolites in a characteristic
