Potential roles of microRNAs in the development of the immune system have been discussed above; however, microRNAs might also be involved in immune defence. A cellular microRNA, miR-32, can regulate primate foamy virus type 1 (PFV-1) proliferation in cell culture (Lecellier et al., 2005).

MicroRNAs (miRNAs) are small, non-coding RNAs that post-transcriptionally regulate gene expression and are increasingly recognized as crucial factors in development and disease. MiRNAs regulate aspects of the immune system and inflammation in cystic fibrosis (CF), including cytokines, proteases activity, and expression of the CF transmembrane conductance regulator (CFTR).
